

Lice Clinics Australia Treatment Options

Depending on your personal needs and budget, we can provide you with treatment options:

Signature Treatment:

Using our exclusive, FDA-cleared and TGA registered medical device, this treatment takes about an hour and has been clinically proven to killing the living lice and 99.2% of their eggs (nits). We follow this up with a comb-out and pesticide-free topical rinse. Using this procedure, we guarantee you will leave our clinic lice-free. Available at all clinics.

Express Treatment:

This option is designed for those who want the professional AirAllé treatment but feel they can handle the comb-out procedure themselves. We do a complete and thorough treatment using the AirAllé device to kill the lice and their nits. Then we provide you with an I Hate Lice kit that contains a pesticide-free topical rinse, combing mousse and a professional comb for you to finish the job at home.

Did you know?

Head lice have become resistant to traditional over-the-counter products!*

Guaranteed results even on Super Lice.

AUSTRALIA

Treatment for head lice and their eggs!

- Fast and Non-toxic
- Guaranteed results
- FDA Cleared and TGA Registered

One & Done 

Treatment Guaranteed

Lice Clinics Australia are here at last!

We provide a revolutionary One-and-Done treatment for the eradication of head lice and their eggs. This revolutionary non-toxic lice treatment was developed by Professor Dale Clayton of the University of Utah in the USA.

The only one-and-done professional lice removal treatment

AirAllé® (pronounced air-a-lay)

- An FDA-cleared and TGA registered medical device
- Kills head lice and 99.2 percent of lice eggs
- A single, one-hour treatment
- Used by lice-removal professionals around the world
- Provides a safe, fast and highly effective lice treatment

How we do it

The FDA Cleared and TGA Registered AirAllé device kills lice and eggs through dehydration. This is a revolutionary alternative to treating head lice with pesticides, herbal lice remedies, suffocation products or lice combs. The device kills lice and eggs through a specific combination of temperature, airflow, time and technique.

Relax. We will take care of this.

Lice facts

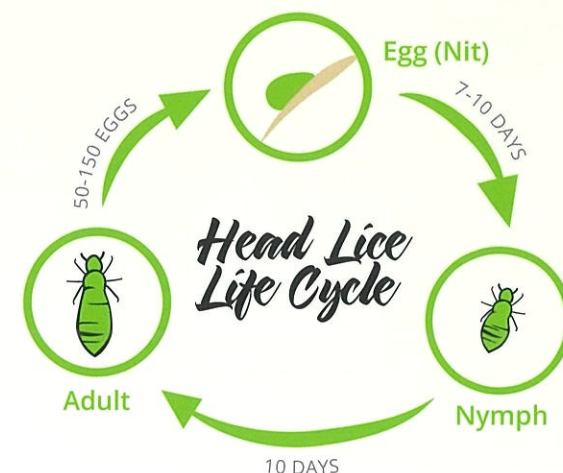

What are head lice?

Head lice are tiny parasitic insects that live on the scalp. They do not live on pets or other animals. A louse (the singular form of lice) has six legs, each with a curved claw that can tightly hold onto hair. Head lice crawl easily between hairs, but they cannot fly or jump.

Head lice only live on human blood and feed several times a day and they live close to the scalp to maintain their body temperature. Lice do not dig or burrow into the skin – they use their needle-like mouthparts to suck blood through the skin.

What are nits?

Nits are lice eggs. Nits look like tiny yellow, tan or brown dots before they hatch. Lice lay nits on hair shafts close to the scalp, where the temperature is perfect for keeping warm until they hatch. Nits look not unlike dandruff, only they can't be removed by brushing or shaking them off. Although much smaller than lice, nits are often easier to spot on the head because they are "glued" to the hair and can't crawl away. After hatching, the remaining shell looks white or clear and stays firmly attached to the hair shaft.

How do you get head lice?

A head louse has six claws that allow it to crawl around from hair strand to hair strand. It can move from one head to another this way, which is why head-to-head contact is the primary way head lice are spread between people, mainly children. This typically happens when they sit or play together in close proximity. Lice eggs cannot move and are not transmissible. Head lice are rarely transmitted via a shared comb, hat or helmet. Clothing, stuffed animals, theatre seats and other items are not threats to spreading head lice. Bathing every day will not prevent or wash away head lice and cleaning the home or bagging toys and clothing won't help you prevent or get rid of head lice.
